WEARABLES MANAGER

BY MATEW

Hello, dear Artist! Thank you for purchasing Matew's Wearables Manager. Like my previous product, DAZ 3D Saveguard, the Wearables Manager was initially created for personal use before I decided to turn it into a commercial product. I'm confident you will find it incredibly useful.

Matew's Wearable Manager contains four scripts that will enhance your experience and productivity in DAZ 3D Studio.

WEARABLES MANAGER TAKE OFF

one-click removal of all items from your figure

The **Wearables Manager Take Off** script detaches all items parented to the current character and stores them in a new group labeled *Character's Name Belongings*. Feel free to rename, reparent, or perform other actions without worry – it does not sever the connection between the Storage Group and your character.

Essential items attached to basic figures by default, such as eyelashes for Genesis 8 or eyes and mouth for Genesis 9, will not be detached.

If you set in the **Wearables Manager Menu** which items to retain, only the specified items will be moved to the Storage Group (see more details below.)

Additionally, you can delete some unnecessary items from the storage folder more conveniently. No need to play Hide & Seek with such assets as piercing or jewelry.

WEARABLES MANAGER PUT ON

restores everything in one click

This script returns all items from the Storage Group to your figure in their original state and restores geoshell materials if necessary.

It will only return items to their original owner, regardless of how many figures are present in the scene. Once items are restored, the Storage Group is removed.

Wearables Manager efficiently handles geografts and geoshells, preventing the loss of material information that typically results in white surfaces, as shown in the right image. Geografts are assets that expand the initial geometry of figures, enhancing detail and creating new surfaces. When you have multiple geografts, unparenting any of them can inevitably lead to the loss of material information created for those geografts. DAZ 3D deletes these materials immediately to prevent memory leakage.

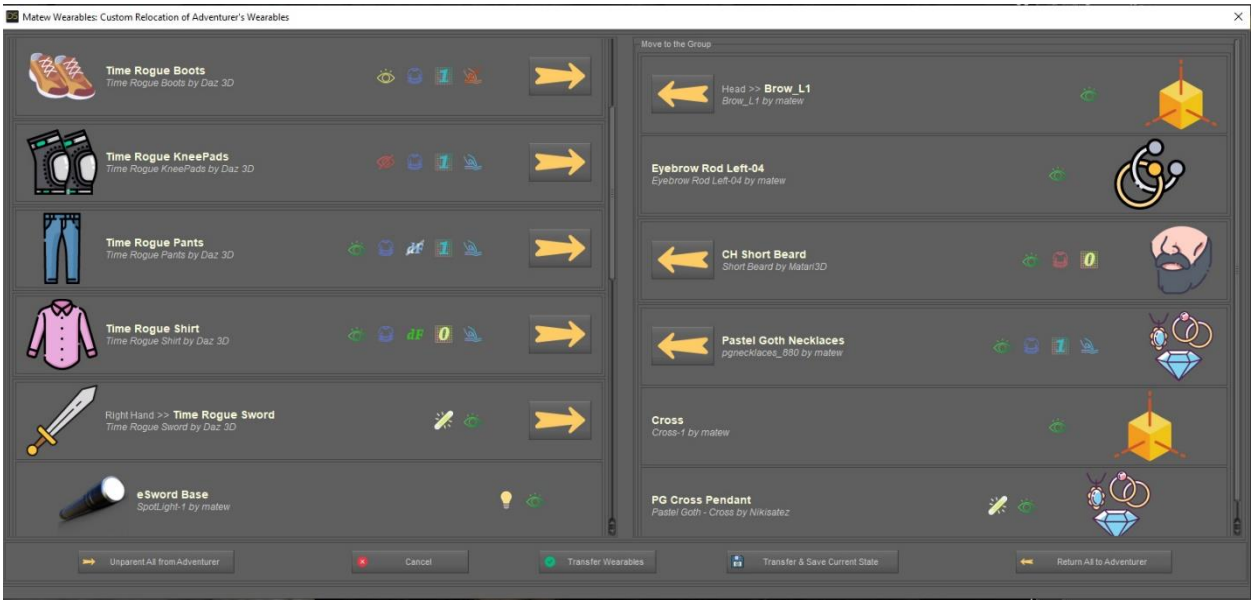

However, it is advisable not to separate geografts and geoshells from each other. If some are attached to the figure while others are detached and located in the Storage Group, a situation may arise where it becomes impossible to preserve information. In such cases, Wearables Manager will revert the changes, returning all items back to your figure to ensure stability and integrity.

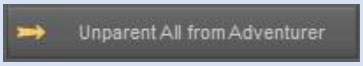

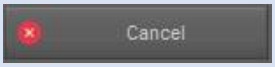

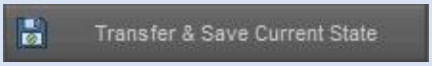

WEARABLES MANAGER MENU

Advanced management of wearables

This interface allows you to select items for transfer and adjust critical parameters from a single screen. Here's an overview of the functionalities:

Button	Function
	Unparents an item from your figure and transfers it to the Storage Group.
	Returns an item from the Storage Group back to your figure.
	Unparents all the items from your figure and transfers them to the Storage Group.
	Returns all the items from the Storage Group back to your figure.
	Closes the Menu without transferring items.
	Executes the transfer of selected items.

	Executes the transfer of selected items and saves the current state. After saving, **Wearables Manager Take Off** Script will take off only the items that are currently moving to the Storage Group (shown on the right side). To reset it, move all items to the right and repeat this action.
	Clicking on any item selects it on the *Scene Viewer Panel.* Hold Shift to select a several items.
	**Green sign** shows that the item has an active **dForce modifier**. **Blue crossed sign** means that **Freeze Simulation** is On. **Red crossed sign** means that the item has a dForce modifier, but it's not active now. Hover over the sign to find out the reason. Left click on the sign toggles **Freeze Simulation** On / Off. Shift + Click jumps to the *Freeze Simulation* property on the *Parameters Panel.*
	**Yellow sign** shows that the item has an **emissive surface**(s). **Grey sign** means that the item has **turned off emissive surface**(s). **Half yellow sign** shows the item has **several emissive surfaces**. Some of them are turned on, and some are turned off. Hover over the sign to find out the details. Click on the sign **toggles emissive** surface(s) On / Off. Shift + Click **selects all emissive** surfaces on *Surfaces Panel.* Ctrl + Click allows to **pick up emissives** you want to turn On / Off.
	**Blue sign** means that the item **fits to the current figure**. **Purple sign** means that it **fits to something else**. Hover over the sign to find out the details. **Red sign** means that the figure **fits to none**. Click on the sign to jump to *Fit To property* on the *Parameters Panel.*
	Shows if the light is On or Off. Click toggles the current light On / Off. Shift + Click jumps to the light properties on the *Parameter Panel.*
	**Green sign** means that the item is visible. **Red sign** means that the item is invisible.

	Yellow sign means that the item is invisible either in Viewport or in render. Hover over the sign to find out the details. Click **toggles Show / Hide** the item. Shift + Click jumps to the *Display* properties on the *Parameters Panel*. Ctrl + Click allows to set the visibility On / Off in *Viewport* and / or in *render*.
	**Blue sign** means that the item has a **Smooth Modifier and collides with the current figure**. **Blue sign with yellow >** means that the item has a **Smooth Modifier and collides with another figure**. Hover over the sign to find out the details. **Blue sign with a red cross** means that the item has a Smooth Modifier and **collides with nothing**. **Half red waiving line** means that an **Interactive Update is On**. It may significantly decrease the responsiveness of the system. **Red crossed sign** means that the **Smooth Modifier is Off**. Hower over the sign for the details. Click **toggles the Smooth Modifier** On / Off. Shift + Click jumps to the *Mesh Smoothing* properties on the *Parameters Panel*.
	**Yellow Zero, One, and Two Plus** appear if the item is **converted into SubD** and show its *View SubD Level*, which is equal to the minimum *Render SubD Level*. **Gray Zero** means that the item is not converted into SubD. Click on the Gray Zero sign **converts item into SubD** and sets its SubD to one. Click on other signs **toggles the item's SubD** level 0-1-2-0. Shift + Click jumps to the *Mesh Resolution* properties on the *Parameters Panel*.

WEARABLES MANAGER FULL

All-in-one script with extended capabilities

This comprehensive script combines all other scripts' functionalities and offers additional features depending on the modifier key used during interaction:

Combination	Outcome
Click	Activates **Wearables Manager Take Off** script.
Shift + Click	Activates **Wearables Manager Put On** script.
Ctrl + Click	Launches the advanced **Wearables Manager Menu**.
Alt + Click	Removes all wearables, **including default items**.
Ctrl + Alt + Click	Launches the **advanced menu with default items** included.

This script perfectly fits for placing on the Toolbox. To do that, please follow this instruction:

1. Right-click on **Wearables Manager Full** and choose Create Custom Action;
2. Navigate to Menu Window → Workspace → Customize (or press F3).
3. Locate **Wearables Manager Full** in the Actions section, typically at the end of the Custom.
4. In the Activities section on the right side of the screen, ensure your desired Toolbar is active.
5. Go to the Tool Bars tab and drag Wearables Manager Full to your preferred location.

KNOWN ISSUES

Tested in DAZ 3D Studio v. 3.21. Some issues may not appear in later versions.

- **Material Preservation:** When parts of geografts and geoshells are moved into the Storage Group while others remain attached to the figure, in some cases it may become impossible to preserve all materials, causing the system to roll back to the initial state.
  Solution: Move geografts and geoshells together to avoid this issue.
- **Parameters Panel Initialization**: DAZ 3D Studio may crash when you use Wearables Manager Menu to navigate through Parameters Panel if you haven't used Parameters Panel at least once manually. DAZ Script does not explicitly support navigation on the Parameters Panel, which likely causes the issue.
  Solution: Click on the Parameters Panel upon starting DAZ 3D to initialize it. If the panel is visible at startup, it is already initialized.
- **Surfaces Panel Navigation**: the same thing may happen if you're navigating on Surfaces Panel using Wearables Manager Menu without prior using of the Surfaces Panel manually.
  Solution: Click on the Surfaces Panel upon starting DAZ 3D to initialize it. If the panel is visible at startup, it is already initialized.
